APPENDIX B. ADAPTATION OF THE SPORT DRUG CONTROL MODEL FOR COACHES	

Introduction

Social science research in doping in sport attempts to understand why athletes dope and how they do it; hence it helps to improve educational and interventional anti-doping programs. Whereas investigation on biomedical and legislative aspects of doping began in the 1960s (Beckett and Cowan, 1978), research on psychosocial doping factors was initiated in the 1990s (García- Grimau et al., 2020). Understanding the psychology of doping remains a challenge for social researchers due to the complex nature of the different variables influencing doping behavior (Blank et al., 2016). Researchers in this field have explored through different theoretical models all the possible factors that influence intentions and attitudes toward doping behavior (Donovan et al., 2002; Strelan and Boeckmann, 2003; Petróczi and Aidman, 2008).

The Sport Drug Control Model as a theoretical framework to study the psychology of doping in sport

To date, regarding quantitative studies there is no standard model and multiple scales of measurement and multiple questions items exist. The World Anti-doping Agency (WADA) provides a Social Science Research Package with a useful guideline for measuring athletes' responses in each of the Sport Drug Control Model's (SDCM) domains that influence doping attitudes and behavior (Social Science Research Package, WADA, 2015). Specifically the SDCM analyzes the following factors: morality, legitimacy, benefits and threat appraisals, motivational profiles, beliefs about reference groups' endorsement of doping methods/substances, use of legal supplements, beliefs about the availability of performance-enhancing substances (PES) and relevant authorities' control over trafficking of doping methods/substances, beliefs about the affordability of doping methods/substances, attitudes toward doping, susceptibility to doping, and self-reported use of banned substances (PES) or methods (PESM).

The SDCM incorporates different frameworks from the behavioral sciences (Nicholls et al., 2014) and considers the particularities of competitive sport, such as the existence of legal methods to improve performance and the influence of environmental and cultural beliefs (Lazuras, 2016). The SDCM has been quantitatively examined twice in Australian elite athletes and the items used have shown validity and reliability (Gucciardi et al., 2010; Jalleh et al., 2013). However, it is necessary to analyze the model in different populations and cultures to further develop it (Jalleh et al., 2013).

Doping prevalence measurements: how to improve quality and reliability?

Due to the intrinsic nature of doping in sport, a banned and socially rejected practice, the measurement of the prevalence of doping remains difficult and unclear, especially in competitive level, therefore data prevalence is potentially underestimated. The prevalence of doping in elite sports is likely to be between 14 and 39 % (De Hon et al., 2015). A recent meta-analysis study shows a disparate range between 0% and 73% (Gleaves et al., 2021) where authors suggest best practice recommendations and guidelines to improve the evidence quality in this field. However, the estimation of the prevalence of doping based on self-report survey provide a higher rate of dopers than the official laboratory statistics, which reflects better what is happening in "the real

world" of competitive sport. Also, prevalence figures provide a tool for evaluating the effectiveness of anti-doping policies.

For all those reasons, there is a need to empirically test de SDCM in other countries and beyond the athlete population. In addition, studies on attitudes and behavior toward doping in Spanish athletes are scarce and mainly focused on cycling (Morente-Sánchez et al., 2013a,b), soccer (Horcajo and de la Vega, 2014, 2016; Morente-Sánchez and Zabala, 2015; Horcajo and Luttrell, 2016) and triathlon (Morente-Sánchez et al., 2013a; Maestre, 2015), and the prevalence of doping is unknow. This project research will analyze for the first-time attitudes towards doping and prevalence of doping in competitive Spanish track and field athletes and coaches.

OBJECTIVES

Phase 1:

- 1. To assess via structural equation modelling, the extent to which the variables in the SDCM together predict attitude and susceptibility towards the use of PES in competitive Spanish track and field athletes.
- 2. To assess the relative importance of the various concepts in the model.
- 3. To measure self-reported doping prevalence in athletes

Phase 2:

- 1. To adapt and apply for the first time the SDCM in coaches.
- 2. To determine the factors in the SDCM that most influence coaches' attitudes and susceptibility toward doping.
- 3. To measure self-reported doping prevalence in coaches.

Phase 1: Testing the Sport Drug Control Model in competitive Spanish track and field athlete.

In this first phase, all the aforementioned objectives were accomplished. We empirically tested the SDCM while analyzing for the first time the intentions and attitudes toward doping in competitive Spanish track and field athletes. In order to do so we had to sworn translate the SDCM questionnaire into Spanish. This translated questionnaire was sent to WADA for their consideration as also previously stated in the research project. The manuscript was published in the journal 'Frontiers in Psychology', which is a Q2 Citation Reports (JCR) journal.

Methods

Participants and design

We conducted a cross-sectional online survey to examine Spanish track and field (athletics) athletes in 2020. Participants were 281 Spanish elite and national standard track and field athletes from whom 80.1% were 18-28 years old and 49.5% were females. Descriptive statistics of athletes' characteristics are presented in Table 1 below.

Table 1. Characteris	tics of the participants: athletes	
n		281
	Male	50.5%
Gender	Female	49.5%
	18-20	26%
Age range (years)	21-24	34.5%
	25-28	19.6%
	29-32	8.2%
	≥ 33	11.7%
	Olympic Games	5.6%
Competition level	World Athletics Championships	18%
	European Athletics Championships	14.7%
	Other International events with the national team	10.1%
	National Athletics Championships	44.8%
	Regional Championships	6.8%
	Middle- long-distance	61.6%
Athletic discipline	Race walking	4.3%
	Sprinting/hurdle	17.1%
	Jumping/throwing	13.9%
	Combined events	3.2%
	< 5000 €	73.3%
Sport income	5000-9.999 €	11.4%
	10.000-19.999 €	8.9%
	20.000-39.999 €	4.6%
	> 40.000 €	1.8%

Participants completed the SDCM questionnaire measuring the following constructs (1) morality, (2) legitimacy; (3) benefits appraisal; (4) threat appraisal; (5) personality traits; (6) beliefs about reference groups' endorsement of doping methods/substances; (7) use of legal supplements; (8) beliefs about the availability of PES and relevant authorities' control over trafficking of doping methods/substances; (9) beliefs about the affordability of doping methods/substances; (10) attitudes toward doping, (11) susceptibility to doping and (12) self-reported use of banned performance-enhancing substances or methods. Description of the questionnaire constructs and measures are presented in table 2 below.

Table 2. Description of the questionnaire

Modules/constructs from WADA guidelines	Construct measures*	Question number**
Morality	Moral decision-making, moral stance, moral affect, moral disengagement (6-items scale, Kavussanu et. al, 2016).	Q1, Q2, Q3, Q4
Legitimacy	Distributive justice.	Q5, Q6, Q7
Benefit appraisal	Perceived performance-enhancing effects of banned substances and methods, Likelihood of potential positive outcomes.	Q8, Q9, Q10, Q11
Threat appraisal	Threats of enforcement, threats relating to ill-health effects.	Q12, Q13, Q14, Q15
Personality traits	Self-efficacy to refrain from doping, goal orientations.	Q16, Q17
Reference Groups' Endorsement of Doping Methods/Substances	Subjective norms.	Q18, Q19, Q20
Availability of PESM and relevant authorities' control over trafficking of doping methods/substances	Perceived availability of PES, access to banned PES, perceived access to medical advice on use of PES, perceived efforts of relevant authorities in enforcing laws against trafficking of PESM.	Q21, Q22, Q23, Q24, Q25
Affordability of PESM	Perceived affordability of PESM.	Q26
Beliefs about Other Athletes' Attitudes towards and use of doping	Descriptive norms.	Q27
Belief about societal influences on doping	Belief about societal influences on doping.	Q28, Q29, Q30
Use of nutritional supplements and other technologies	Use of nutritional supplements, use of other technologies	Q21, Q32
Performance-Enhancing Drug use	Frequency of use of PESM in the past 12 months.	Q33. Q34
Demographic and sporting background	Athletics discipline, competition level, income from sport, age group, and gender.	Q35, Q36, Q37, Q38, Q39
Overall Susceptibility to doping	Susceptibility, attitudes, and intention to doping.	Q40, Q41, Q42, Q43, Q44

The final SDCM 44-items questionnaire can be found in Appendix A. All the items in the questionnaire belong to the Social Science Research Package (WADA, 2015) with the exception of the morality construct which was measured using the 6-items from Moral Disengagement in Doping Scale (Kavussanu et al., 2016). Moreover, the factor 'susceptibility to doping' has been included as a dependent variable in our analysis, along with doping attitudes and behavior.

^{*}See section 5 of WADA's social science research package for full descriptions of measures and items.

**See Appendix A. WADA: World Anti-doping Agency; NADO: National Anti-doping Organization; PES: performance-enhancing substances; PESM: performance-enhancing substances and methods.

Protocol

Prior to starting the data collection, Ethics committees from Isabel I de Castilla International University (UI1-PI016) and World Anti-Doping Agency (2019- A2) provided ethical approval for the completion of the study. Before filling out the online survey, all the participants signed a consent form to participate in the study which was conducted in accordance with the Declaration of Helsinki. Athletes were informed about the aims and purposes of the study, that the project was funded by WADA, and reassured about their anonymity and confidentiality of their data. Participants were selected according to their performance level. The inclusion criterion was having achieved a qualification standard for participation in either a senior or age category (under 20 years [U-20] or under 23 years [U-23]) national athletics championship.

Coaches of twenty-four training groups nationwide were contacted via e mail or telephone and asked to allow their athletes to take part in a short survey. WhatsApp 2.18.52 (Mountain View, California, USA) groups were created, and athletes were invited to participate in the online survey (via link). Although the main contact was done via the coaches, who facilitated participation of their athletes, some athletes were recruited directly via telephone.

Results

Missing values were checked before statistical analysis. Missing data for each variable was low (i.e., 0.4-3.1%) and replaced through the expectation maximization method (Graham, 2009). Descriptive statistics, reliability and internal consistency analysis of the study variables were performed through the Statistical Package for the Social Sciences (SPSS) version 24.0 (IBM, Armonk, 234 NY, USA). MacDonalds's Omega (ω) and Composite Reliability values were >0.7 and Average Variance Extracted values were >0.5 which indicates a good reliability and internal consistency of the questionnaire suitable for uctural equation modelling (SEM) analysis. SEM supported a good fitness of the SDCM and confirmed that positive attitudes towards doping predicted high susceptibility to doping (β =0.55, p<0.001), which is in turn associated with the use of prohibited substances and methods (β =0.12, p<0.05). The factors that have most influence on attitudes towards doping are morality (β =0.46, p<0.001) and reference group opinion (β =0.62, p<0.001) (see figure 1). Self-reported doping use was 9.6%.

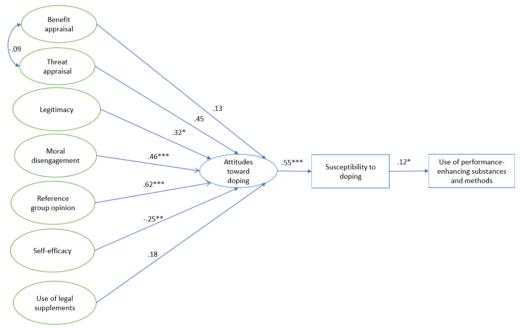

Figure 1. Overview of results of structural equation model analysis with standardized parameter estimates. Different levels of significance according to p value: *p<.05, **p<.01, and ***p<.001.

Phase 2: Testing the Sport Drug Control Model in Spanish track and field coaches.

Coaches strongly influence athletes' attitudes toward doping and can shape athlete's beliefs, behaviors, and decisions to be for or against doping (Barkoukis et al., 2019). The impact of the athlete's entourage on attitudes toward doping has been reported in different studies (Backhouse and McKenna, 2012; Mazanov et al., 2014; Engelberg and Moston, 2016). In this second phase of the project, we applied for the first time the SDCM in coaches with the aim of assessing the reproducibility of the model in athletes' support personnel. We determined the factors in the SDCM that most influence coaches' attitudes and susceptibility toward doping, and their doping prevalence. In this way, we achieved the objectives of phase two of the project. In order to apply the SDCM in coaches, the questionnaire was adapted for this population (see appendix B).

Researcher Elena García Grimau received an invitation from Dr. Andrea Petroczi to publish the manuscript in a new research topic entitled 'Women in Anti-doping Science 2021' and hosted by Frontiers in Sport and Active Living journal. The manuscript has been approved for production and accepted for publication in Frontiers in Sports and Active Living, section Anti-doping Sciences.

Methods

Participants and design

Athletics is the third summer Olympic sport most affected by doping, reporting 15% of the total anti-doping rules violations worldwide in 2018 (World Anti-doping Agency, 2020). However, to the best of the authors' knowledge no study analyzing attitudes and behavior toward doping in Spanish athletics coaches has been conducted previously. Thus, athletics coaches were recruited between February and March 2021 to participate

in a cross-sectional online survey via e-mail from the database of the National School of Coaches of the Royal Spanish Athletics Federation. The questionnaire was sent to 1432 coaches of whom 201 completed the survey. Descriptive statistics of coaches' characteristics are presented in Table 3 below.

Table 3. Characteris	tics of the participants: coaches	
n	· · · · ·	201
	Male	88.6%
Gender	Female	11.4%
	< 25	23.4%
Age range (years)	25-29	4 %
	30-39	12.4%
	40-29	21.9%
	50-59	27.9 %
	≥ 60	10.4 %
	Olympic Games	9.5%
Competition level	World Athletics Championships	11.9%
achieved by their	European Athletics Championships	10%
athletes	Other International events with the national team	15.4%
	National Athletics Championships	45.8%
	Regional Championships	7.5%
	Middle- long-distance	38.8%
Athletic discipline	Race walking	4.5 %
expertise	Sprinting/hurdle	26.9%
	Jumping/throwing	19.9%
	Combined events	10%
	< 5000 €	61.2%
Sport income	5000-9.999 €	21.4%
	10.000-19.999 €	11.9%
	20.000-39.999 €	4.0%
	> 40.000 €	1.5%

Participants completed the SDCM questionnaire measuring the following constructs: (1) moral disengagement; (2) benefits appraisal; (3) threat appraisal; (4) self-efficacy to refrain from doping; (5) goal orientations; (6) subjective norms: reference groups' endorsement of doping methods/substances; (7) descriptive norms: belief of doping use in others; (8) attitudes toward doping, and (9) susceptibility to doping. All measures used in this study can be found in Appendix B.

Protocol

Ethics committees from Isabel I de Castilla International University (UI1-PI016) and World Anti-Doping Agency (2019-A2) provided ethical approval for the completion of the present study. All the participants signed a consent form to participate in this study which was conducted in accordance with the Declaration of Helsinki. Coaches were informed about the aims and purposes of the study, that the project was funded by WADA, and reassured about their anonymity and confidentiality of their data.

Results

Descriptive statistics, reliability and internal consistency analysis of the study variables were performed through the Statistical Package for the Social Sciences (SPSS) version 24.0 (IBM, Armonk, 234 NY, USA). Missing values were checked before statistical analysis. Missing data for each variable was low (i.e., 0.0-4.4%) and replaced through the expectation maximization method (Graham, 2009). Means (95% confident intervals [CI]), standard deviations (SDs), McDonald's Omega (ω), average variance extracted (AVE) and composite reliability (CR) were calculated as a measure of reliability and internal consistency. SEM was carried out to test the SDCM in coaches through AMOS package for SPSS version 24.0. An examination of the measurement portion of the model and setting constraints was made to avoid identification issues.

Descriptive statistics for the different variables analyzed (see Table 4) indicate that coaches reported on average negative attitudes towards doping and low levels of susceptibility to doping and moral disengagement. With respect to psychological factors, coaches stated on average a high self-efficacy to refrain from doping and moderate ego-oriented goals. Regarding social norms, they reported a high subjective norm. They believed that, on average, reference groups would disapprove doping behaviors. With respect to descriptive norms, coaches perceived an average doping prevalence of 19.5% (1.95 ± 1.74 [mean \pm SD]).

Table 4. Descriptive statistics, reliability and internal consistency estimates for the variables measuring the sport drug control model through structural equation modeling.

Variables	Range	Mean (CI)	SD	ω	AVE	CR
Susceptibility to doping	(1) not at all to (4) a lot of consideration	1.08 (1.04,1.13)	0.32			
Attitudes toward doping	(1) definitely don't have to use to (5) definitely have to use	1.67 (1.52,1.81)	1.05			
Moral disengagement	(1) Strongly disagree to (7) strongly agree	1.37 (1.28,1.46)	0.66	0.68	0.48	0.77
Benefit Appraisal	Performance enhancing effect: (1) would not to (5) definitely would	3.21 (3.06,3.36)	1.07	0.89	0.59	0.89
	Positive outcomes: (1) a lot to (3) not at all	1.50 (1.45,1.55)	0.34	0.72	0.48	0.82
Threat appraisal	Testing likelihood: (1) Very likely to (5) Not at all likely	3.57	1.27			
	Evading detection: (1) Very likely to (5) Not at all likely	2.83	1.20			
	III-health effect: (1) A lot of harm to (5) no harm	2.07 (1.9,2.24)	1.10	0.94	0.73	0.94
Motivational profiles: Self-efficacy to refrain from doping	(1) completely capable to (7) Not at all capable	1.59 (1.37,1.80)	1.54	0.98	0.84	0.98
Motivational profiles: ego-oriented goals	(1) strongly disagree to (5) strongly agree.	2.14 (2.03,2.26)	0.83	0.82	0.53	0.87
Subjective norms: Reference Groups' Endorsement of Doping	(1) would definitely approve to (5) would definitely disapprove	4.14 (4.04,4.24)	0.74	0.88	0.61	0.95
Descriptive norms: perception of others' use of doping		19.5* (17.1,22.0)	17.4	0.93	0.76	0.94

CI: confident intervals; SD: standard deviation; ω: McDonald's ω; AVE: average variance extracted; CR: composite 569 reliability * Average percentage of perceived doping

Measures showed good internal consistency and reliability, with ω values > 0.6, AVE values > 0.4 and CR values > 0.7. Self-reported doping prevalence among coaches was 4.5%, and 3% acknowledged having had an athlete who has tested positive for a prohibited substance. The SEM analysis of the SDCM in coaches (see Figure 2) revealed a good fit of the data: χ^2 /df = 1.76, p < 0.001, CFI = 0.93, TLI = 0.96, RMSEA = 0.062 (90% CI = 0.054, 0.070), SRMR = 0.09. Covariance between moral disengagement and subjective norms, and between subjective norms and descriptive norms did not change the model fitness and improved the standardized parameter estimates and significance. Positive attitudes toward doping predicted high susceptibility to doping (β = 0.39, ρ < 0.001). Moral

disengagement (β = 0.58, p < 0.001), descriptive norms (β = 0.42, p = 0.001), egooriented goals (β = 0.34, p < 0.05), and self-efficacy to refrain from doping (β = 0.26, p < 0.05) displayed a significant influence on attitudes toward doping. These variables should be considered when designing anti-doping research projects and educational programs aiming at modifying coaches' attitudes towards doping.

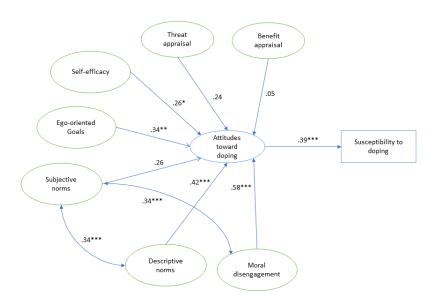

Figure 2. Overview of results of structural equation model analysis with standardized parameter estimates. Different levels of significance according to p-value: * $p \le 0.05$, ** $p \le 0.01$, and *** $p \le 0.001$.

Discussion

The Sport Drug Control Model is likely to be the model which most explicitly represents the theoretical paradigm of the psychological study of the use of doping in sport (Kirby et al., 2016). This model can be further developed through its analysis in different populations and cultures. To our knowledge, published study has test the SDCM in Australia (Gucciardi et al., 2010; Jalleh et al., 2013) and adolescent athletes from United Kingdom, Australia, United States, and Hong Kong (Nicholls et al., 2020), and has not yet been applied either in Spain or in athletes' support personnel (ASP). The main objectives of this research project were to empirically test the SDCM while analyzing for the first time the intentions and attitudes toward doping in Spanish track and field athletes and coaches. Secondary project purpose was to determine the factors in the SDCM that most influence athletes and coaches' attitudes and susceptibility toward doping, and their doping prevalence.

Primary outcomes from phase 1 displayed that positives attitudes toward doping predicted high susceptibility to doping, which is in turn associated with the use of prohibited substances and methods. The observed strength of the relationship between attitudes toward doping and doping susceptibility are in agreement with results from other studies (Gucciardi et al., 2010; Barkoukis et al., 2013; Blank et al., 2016; Nicholls et al., 2020).

The factors that were found to have the greatest influence on attitudes toward doping in athletes are morality and reference group opinion. Preliminary evidence showed that moral variables are strong predictors of doping attitudes and behaviors (Ntoumanis et al., 2014; Backhouse et al., 2015, Kavussanu et al., 2019). An important change in our study is the measurement of the morality construct under the concept of moral disengagement, using the scale of Moral Disengagement of Doping in Sport (MDDS, Kavussanu et al., 2016). In recent studies sampling competitive athletes from different countries, moral disengagement was found to be a strong predictor of positive attitudes toward the use of PES (Hodge et al., 2013; Kavussanu et al., 2019; Ring and Hurst, 2019). Our findings emphasize the potential effectiveness of introducing the concept of morality into antidoping educational programs through practical interventions in order to acquire a strong moral stance against doping and avoid morality disengagement in athletes who are highly susceptible to dope. Intervention programs oriented toward changes in the moral aspect of doping have displayed the greatest effectiveness in antidoping prevention and they are scarcely implemented unfortunately (Gatterer et al., 2020).

Reference group opinion was found to be a significant and positive predictor of attitudes toward the use of doping, which means that the greater endorsement of doping by athletes' reference groups (i.e., coach, teammates, and family) the more prone were attitudes toward doping. This finding is consistent with that from Jalleh et al. (2013). In addition, these results are also in agreement with those from Lazuras et al. (2010) regarding subjective norms, which is a variable that derives from the TPB. The role played by significant others is a crucial contextual variable in understanding attitudes toward doping in athletes. If athletes' closest entourage rejects doping, this would be a protective factor to prevent athletes from being tempted to use banned substances or methods. For this reason, we have focused on analyzing the athlete's support personnel in phase 2 of the research project, specifically its most relevant reference group which is the figure of the coach.

The examination of the SDCM in Spanish elite- and national-standard track and field athletes is a strength of our study because this is the first analysis to date of attitudes toward the use of doping and doping-related behaviors in Spanish track and field competitive athletes. Our findings confirm SDCM reproducibility and variability (as it accounts for several variables).

As previously mentioned, in phase 2 of the study we analyzed attitudes and behaviors toward doping in coaches. Coaches could engage on doping behavior, act as social facilitators in doping in sport (Vakhitova and Bell, 2018) and incite their athletes to commit anti-doping rule violations (ADRVs) (i.e., those displayed in articles ranging from 2.5 to 2.11 of the World Anti-doping Code). Donovan et al. (2002) observed that the SDCM could be adapted for application to ASP but has not yet been applied to coaches. In this study, the SDCM is applied for the first time in coaches with the aim of assessing the reproducibility of the model in ASP. Its application in a new population is an added value to this research.

The most important findings regarding the relationship between the variables were that attitudes toward doping predicted high susceptibility to doping and were significantly influenced by moral disengagement, descriptive norms, ego-oriented goals, and self-efficacy to refrain from doping in athletics coaches. Our results emphasize once

again the relevance of moral variables to be considered in educational programs, whether targeting athletes or coaches. These results are in line with other studies in coaches (Patterson and Backhouse, 2018; Barkoukis et al., 2019) in which moral disengagement displayed a strong influence on doping likelihood acting as a direct predictor or mediator (Ring and Kavussanu, 2018b).

Descriptive norms were a significant and positive predictor of attitudes toward the use of doping in coaches, which reflects that the perception of high prevalence of doping in others could enhance their attitudes toward doping, as they tend to normalize this behavior. Normative beliefs can be considered determinants of attitudes and behavior toward doping in the sport society, therefore its inclusion in anti-doping educational programs should be addressed.

Regarding motivational profiles, self-efficacy, and ego-oriented goals were significant predictors of coaches' doping attitudes in the present study. Coaches with ego-oriented goals and less ability to resist temptations may be more prone to doping. Hence, those motivational factors are strong predictors of attitudes and susceptibility to doping in both coaches and athletes.

Overall, adaptation and application of the SDCM in ASP proves its reproducibility in other population. Our results show that moral disengagement, social norms, and motivational profiles are the strongest predictors of attitudes toward doping among coaches. We truly believe that is necessary to address these psychological-, attitude-, and behaviorrelated issues through educational programs targeting coaches. The results of the present study alongside those from others reveal that coaches tend to morally disengage through a lack of commitment and a diffusion of their responsibilities as educators in doping prevention (Barkoukis et al., 2019), and consider that they do not have adequate tools to prevent their athletes from doping use, while being aware of their role as antidoping educators though (Engelbert et al., 2019; Patterson et al., 2019). All this scientific evidence paints a worrying picture, as coaches could rather represent a doping risk. In the complex context of elite sport in which the influences of sport environment and reference group on athletes are crucial, the absence of doping prevention may involve the presence of risk of its use. Perhaps it is time to focus more efforts on coaches, without putting aside the athletes, and therefore turn coaches into reliable doping prevention factors.

During phase 1 and phase 2 we measured self-reported doping prevalence in athletes (9.6%) and coaches (4.5%). Only one (i.e., use of performance-enhancing substances and methods) from the 11 WADA current doping-related infractions was evaluated. Moreover, doping in sport is a prohibited and socially rejected practice, methods for assessing doping prevalence remain unclear and therefore data prevalence is potentially underestimated due to the sensitivity of the question. The use of multiple measures to triangulate doping prevalence data, and indirect measures like randomized response technique (RRT) may provide more reliable measurements (Gleaves et al., 2021).

Conclusion

This is the first questionnaire written in Spanish analyzing the influence of several factors on doping attitudes and behaviors in athletes and coaches. The development of this questionnaire represents an important step forward for the antidoping community to be able to analyze and evaluate the attitudes and behaviors toward doping in a much

wider population given the great number of Spanish speaking athletes worldwide. The SDCM has been applied for the first time in coaches and displayed reproducibility in ASP. Our research project provides unique and valuable information for application in educational programs in the Spanish anti-doping agency.

It is recommended to enhance anti-doping intervention programs which allow athletes to acquire a strong moral stance against doping. We recommend further research coachcentered to provide more assistance to sport coaches and establish effective and mandatory anti-doping education in them.

Finally, we successfully reached all project objectives within the agreed timeline despite the difficulties encountered due to the Covid-19 pandemic.

Publications:

- 1. García-Grimau E, De la Vega R, De Arce R and Casado A (2021). Attitudes Toward and Susceptibility to Doping in Spanish Elite and National-Standard Track and Field Athletes: An Examination of the Sport Drug Control Model. Front. Psychol. 12:679001. doi: 10.3389/fpsyg.2021.679001
- García-Grimau E, De la Vega R and Casado A (2022). Moral Disengagement, Social Norms, and Motivational Profiles Influence Attitudes Toward Doping Among Spanish Athletics Coaches. Front. Sports Act. Living 4:842959. doi: 10.3389/fspor.2022.842959 Accepted for publication

Planned publications:

One article discussing potential improvements in the Sport Drug Control Model, e.g., describing results based on logistic regression analysis, which will be submitted to *Frontiers in Psychology* (or another relevant journal).

One article comparing attitudes toward and susceptibility to doping between track and field competitive athletes and coaches will be submitted to *Journal of Sport and Health Science* (or another relevant journal).

Presentations at International Congress:

- 1. García-Grimau E. (2021). Attitudes Toward and Susceptibility to Doping in Spanish Elite and National-Standard Track and Field Athletes: An Examination of the Sport Drug Control Model. Virtual Poster Session, Partnership for Clean Competition Congress, 19 May.
- 2. An abstract entitled "Moral Disengagement, Social Norms, and Motivational Profiles Influence Attitudes Toward Doping Among Spanish Athletics Coaches"

will be sent to an International Congress (e.g., Conference of the European College of Sport Science or another one) during 2022.

Appendix

Appendix A. Sport Drug Control Model 44-items Questionnaire.

Questions	Scale
Q1. In the list below there are some things that people have	(1) Strongly
said about cheating and fair play in sport. Please read each one	disagree to (5)
and circle one of the numbers beside it to show how much you	Strongly agree
agree or disagree with it. Some of these are not very different	0, 0
so you will have to carefully examine each statement.	
1. It is ok to cheat if nobody knows.	
2. Winning and losing are a part of life	
3. I sometimes try to wind up the opposition	
4. I would cheat if I thought it would help me win.	
5. It is ok to lose sometimes because in life you don't win	
everything.	
6. It is not against the rules to psych people out so it's ok to do	
so.	
7. If other people are cheating, I think I can too.	
8. If you win properly, it feels better than if you did it	
dishonestly.	
9. Sometimes I waste time to unsettle the opposition.	
10. I cheat if I can get away with it.	
11. You have to think about the other people and not just	
winning.	
12. If I don't want another person to do well then I put them	
off a bit.	
13. When I get the chance, I fool the official.	
14. I get annoyed by people trying to "win at all Costs".	
15. It is a good idea to upset your opponent.	
16. I always play by the rules.	
17. Winning is all that matters.	
18. I would never psych anybody out.	
19. I would cheat if I thought it would help me or my team win.	
20. It is understandable that players swear in the heat of the	
moment.	
	(4) (2)
Q2. Regardless of whether you believe performance enhancing	(1) to (3)
substances or methods (PESM) should be banned or allowed,	
which of the following statements best describes your own	
personal feelings about deliberately using banned PESM?	
1. I believe deliberately using banned PESM to improve	
performance is morally wrong under any circumstances.	
2. I believe deliberately using banned PESM to improve	
performance is morally OKunder some circumstances, but	
wrong under others.	
	<u> </u>

3. I believe deiloerately using banned Pass to Improve performance is morally OK under any circumstances. Q3 If you were caught using banned performance enhancing substances or methods, to what extent would you experience the following feelings. 1. Ashamed 2. Embarrassed 3. Guilty Q4. A number of statements describing thoughts that athletes might have about competitive sport are listed below. Please read these statements carefully and indicate your level of agreement. 1. Doping is lairght because it helps your team. 2. Doping is just a way to "maximize your potential". 3. Compared to the illegal things people do in everyday life, doping in sport is not very serious. 4. Players cannot be blamed for doping if their teammates pressure them to do it. 5. A player should not be blamed for doping if everyone on the team is doing it. 6. Doping does not really hurt anyone. Q5. How fair is AEPSAD in terms of treating all athletes equally? Q6. How secure is the AEPSAD'S drug testing procedures in Spain? That is, in the taking of samples and the care of samples? Q7. How accurate do you feel the current drug tests are in terms of being able to correctly identify the following substances? Q8. How serve to use the following substances. S. Human growth hormones (hGH) C9. If you were to use the following substances, how likely is it that these substances would improve your performance in your sport? Anabolic steroids. Designer steroids like tetrahydrogestrinone. Erythropoletin (EPO) and other similar substances. Human growth hormones (hGH). Q9. If you were to use a banned performance enhancing substance of your choice, how likely is it that tyou would improve your performance in your sport?	2. I haliana dalihanatah maina hangad BECM ta imagana	
Q3 If you were caught using banned performance enhancing substances or methods, to what extent would you experience the following feelings. 1. Ashamed 2. Embarrassed 3. Guilty Q4. A number of statements describing thoughts that athletes might have about competitive sport are listed below. Please read these statements carefully and indicate your level of agreement. 1. Doping is alright because it helps your team. 2. Doping is just a way to "maximize your potential". 3. Compared to the illegal things people do in everyday life, doping in sport is not very serious. 4. Players cannot be blamed for doping if everyone on the team is doing it. 5. A player should not be blamed for doping if everyone on the team is doing it. 6. Doping does not really hurt anyone. Q5. How fair is AEPSAD in terms of treating all athletes equally? Q6. How secure is the AEPSAD'S drug testing procedures in Spain? That is, in the taking of samples and the care of samples? Q7. How accurate do you feel the current drug tests are in terms of being able to correctly identify the following substances? 1. Anabolic steroids 2. Beta-blockers 3. Designer steroids like tetrahydrogestrinone (THG) 4. Erythropoietin (EPO) and other similar substances 5. Human growth hormones (hGH) 6. Diuretics Q8. If you were to use the following substances, how likely is it that these substances would improve your performance in your sport? 1. Anabolic steroids 2. Beta-blockers 3. Designer steroids like tetrahydrogestrinone. 4. Erythropoietin (EPO) and other similar substances. 5. Human growth hormones (hGH). Q9. If you were to use a banned performance enhancing substance of your choice, how likely is it that you would	3. I believe deliberately using banned PESM to improve	
substances or methods, to what extent would you experience the following feelings. 1. Ashamed 2. Embarrassed 3. Guilty Q4. A number of statements describing thoughts that athletes might have about competitive sport are listed below. Please read these statements carefully and indicate your level of agreement. 1. Doping is alright because it helps your team. 2. Doping is just a way to "maximize your potential". 3. Compared to the illegal things people do in everyday life, doping in sport is not very serious. 4. Players cannot be blamed for doping if their teammates pressure them to do it. 5. A player should not be blamed for doping if everyone on the team is doing it. 6. Doping does not really hurt anyone. Q5. How fair is AEPSAD in terms of treating all athletes equally? Q6. How secure is the AEPSAD'S drug testing procedures in Spain? That is, in the taking of samples and the care of samples? Q7. How accurate do you feel the current drug tests are in terms of being able to correctly identify the following substances? 1. Anabolic steroids 2. Beta-blockers 3. Designer steroids like tetrahydrogestrinone (THG) 4. Erythropoietin (EPO) and other similar substances 5. Human growth hormones (hGH) 6. Diuretics Q8. If you were to use the following substances, how likely is it that these substances would improve your performance in your sport? 1. Anabolic steroids like tetrahydrogestrinone. 4. Erythropoietin (EPO) and other similar substances. 5. Human growth hormones (hGH). Q9. If you were to use a banned performance enhancing substance of your choice, how likely is it that you would		(4) 21
the following feelings. 1. Ashamed 2. Embarrassed 3. Guilty Q4. A number of statements describing thoughts that athletes might have about competitive sport are listed below. Please read these statements carefully and indicate your level of agreement. 1. Doping is alright because it helps your team. 2. Doping is just a way to "maximize your potential". 3. Compared to the illegal things people do in everyday life, doping in sport is not very serious. 4. Players cannot be blamed for doping if their teammates pressure them to do it. 5. a positive drug test in your sport severe or lenient?	(4) very lenient + I
	do not know
Q15. How much harm to your health do you think would be	(1) No harm to (4)
caused by using each of the following substances for a short	a lot of harm + I
time say up to two months?	do not know
1. Anabolic steroids.	
2. Beta-blockers.	
3. Designer steroids like tetrahydrogestrinone.	
4. Erythropoietin (EPO) and other similar substances.	
5. Human growth hormones (hGH).	
6. Diuretics	
6. Diuretics	

Q16. Here are several scenarios that you may have	(1) Not at all
encountered or may come across during your career in sport.	capable to (7)
Please rate the extent to which you currently feel capable in	completely capable
being able to avoid or overcome these situations using the	
scale below.	
1. To avoid using banned PEDMs before a competition even	
when you know you can get away with it.	
2. To avoid using banned PEDMs in sport even when you feel	
down physically.	
3. To resist the temptation to use banned PEDMs to improve	
your performance.	
4. To resist the temptation to use banned PEDMs to have a	
body that others would admire, even when no-one would ever	
know.	
5. To resist the temptation to use banned PEDMs to have a	
great appearance.	
6. To avoid using banned PEDMs to have your body look as you	
would like.	
7. To avoid using banned PEDMs to get results more quickly,	
even when no one would ever know.	
8. To not use banned PEDMs, despite the pressure to do so	
from others.	
9. To avoid using banned PEDMs to improve your performance	
in the sport you practice, even when you know that it will not	
have side-effects.	
10. To avoid using banned PEDMs, even when most of those	
who practice your sport use them	(4) (1)
Q17. Success in sport can mean different things to different	(1) Strongly
people. The statements in this section of the survey capture a	disagree to (5)
variety of ways in which athletes define their sporting success.	Strongly agree
Please read these statements carefully and indicate your level	
of agreement with each one.	
In sport, I feel most successful when I 1. I reach personal goals.	
2. I show clear personal improvement.	
3. I perform to the best of my ability.	
4. I overcome difficulties.	
5. I reach a goal.	
6. I work hard.	
7. I show other people I am the best.	
8. I am the best.	
9. I am clearly superior.	
10. I outperform my opponents.	
11. I beat other people.	
12. I win.	
Q18. If you decided to use a banned performance enhancing	(1) Would
substance, to what extent do you think each of the following	definitely approve

people would approve or disapprove, or would not care either	to (E) Definitely
	to (5) Definitely
way if you did that?	disapprove
1. Your coach.	
2. Parents.	
3. Team mates/training partners.	
4. Team doctor.	
5. Close friends.	
6. Manager.	
Q19. If you were considering using a banned performance	(1) Would
enhancing substance, how much would you take into account	definitely take into
these people's opinions on whether you should or should not	account to (5)
do so?	Definitely not take
1. Your coach.	into account
2. Parents.	
3. Team mates/training partners.	
4. Team doctor.	
5. Close friends.	
6. Manager. Q20. The following statements are intended to provide an	(1) Strongly
	(1) Strongly
insight into your beliefs about other people's opinions towards	disagree to (7)
the athlete using doping.	strongly agree
1.Most people I know would approve of me using prohibited	
substances to enhance my performance during his season.	
2.People who are important to me would approve of me using	
prohibited substances to enhance my performance during this	
season.	
3.Most people close to me expect me to use prohibited	
substances to enhance my performance during this season.	
Q21. How easy or difficult would it be for you to get each of	(1) Probably
the following types of substances if you wanted to?	impossible to (5)
1. Anabolic steroids.	very easy + I do not
2. Beta-blockers.	know
3. Designer steroids like tetrahydrogestrinone.	
4. Erythropoietin (EPO) and other similar substances.	
5. Human growth hormones (hGH).	
6. Diuretics	
Q.22 If you wanted to get and use a banned PES, which of the	(1) Would
· · · · · · · · · · · · · · · · · · ·	` '
following people, if any, do you think would help you if you asked them to do so?	definitely help me
	to (5) definitely
1. Your coach.	would not help me
2. Parents.	+ I do not know
3. Team mates/training partners.	
4. Team doctor.	
5. Close friends.	
6. Manager.	

Q23. If you wanted to use a banned PES, how easy would it be to get good medical advice on how to use the substance?	(1) Probably impossible to (5) very easy + I do not know
Q24. How serious do you feel the following authorities are in preventing trafficking of banned performance enhancing substances in Spain? 1. Police/Guardia Civil	(1) Not at all serious to (5) very serious
2. AEPSAD	
Q25. Overall, how effective do you feel the following authorities are in preventing trafficking of banned performance enhancing substances in Spain? 1. Police/Guardia Civil 2. AEPSAD	(1) Not at all effective to (5) very effective
 Q26. How expensive would it be for you personally to buy each of the following types of substances? 1. Anabolic steroids. 2. Beta-blockers. 3. Designer steroids like tetrahydrogestrinone. 4. Erythropoietin (EPO) and other similar substances. 5. Human growth hormones (hGH). 6. Diuretics 	(1) Very cheap to (5) very expensive + I do not know
Q27. The following statements are intended to provide an	Indicate
insight into your beliefs regarding other athletes' use of	percentage:
doping.	
 Out of 100%, how many athletes in your sport do you believe engage in doping to enhance their performance? Out of 100%, how many elite athletes in your country do you believe engage in doping to enhance their performance? Out of 100%, how many elite athletes do you believe will be engaged in doping during the next 2 years to enhance their performance? 	
4. Out of 100%, how many coaches in your sport do you	
believe would encourage their athletes to use doping to enhance their performance?	
5. Out of 100%, how many coaches in elite sports in your	
country do you believe would encourage their athletes to use	
doping to enhance their performance?	(4) 51
Q28. How much pressure, directly or indirectly, do you think	(1) No pressure at
the Spanish government or the Spanish Olympic Committee puts on elite athletes to win Olympic gold medals?	all to (4) a lot of
Q29. To what extent, if at all, do you think commercial	pressure (1) Had no effect
influences on the Olympics and sport in general have increased	to (4) increase a lot
a 'win at all costs' attitude amongst elite athletes?	
Q30. To what extent, if at all, do you think commercial	(1) Had no effect
influences on the Olympics and sport in general have increased	to (4) increase a lot

the temptation amongst elite athletes to use banned	
performance enhancing substances?	
Q31. How often have you used any of these nutritional	(1) Never to (6)
supplements in the past 12 months?	Systematically
1. Vitamin or mineral supplements.	
2. Herbal products.	
3. Creatine.	
4. Sports drinks.	
5. Energy bars.	
6. Caffeine.	
7. Protein-carbohydrate shakes.	
Q32. How often have you used any of these methods or	(1) Never to (6)
technologies in the past 12 months?	Systematically
1. High altitude stages.	
2. Hypoxic training.	
3. Intravenous therapy with permitted substances.	
4. Ozone therapy	(4) 1 - (7)
Q33. Which one of the following most applies to you?	(1) to (7)
1. I have never considered using a banned performance-	
enhancing substance.	
2. At one stage I thought briefly about using a banned	
performance-enhancing substance.	
3. At one stage I thought quite a bit about using a banned	
performance-enhancing substance. 4. I still think occasionally about using a banned performance-	
enhancing substance because other athletes are using them.	
5. I briefly used a banned performance-enhancing substance in	
the past but no longer do so.	
6. I occasionally use a banned performance-enhancing	
substance now for specific purposes.	
7. I regularly try or use banned performance-enhancing	
substances.	
Q34. In the last 12 months, how often have you used any of	(1) Had never use
the following, for whatever reason?	to (6) more than
1. Anabolic steroids.	10 times
2. Beta-blockers.	
3. Designer steroids like tetrahydrogestrinone.	
4. Erythropoietin (EPO) and other similar substances.	
5. Human growth hormones (hGH).	
6. Diuretics	
7. Doping methods	
Q35. Indicate the athletic discipline you practice:	(1) to (4)
1. Sprinting – hurdles	
2. Middle distance / long distance (includes race walking on	
road).	
3. Jumps and throws	
4. Multi-events	

Q36. What is the highest level you have competed at?	(1) to (6)
1. Olympic games	
2. World championship	
3. European championships	
4. Other International competition with the national team	
5. National level competition	
6. Regional level competition	
Q37. What is your total annual income from all sport sources?	(1) to (6)
1. Less than 5,000 euros.	
2. 5,000 to 9,999.	
3. 10,000 to 19,999.	
4. 20,000 to 39,999.	
5. 40,000 to 59,999.	
6. More than 60,000	
Q38. What is your age group?	(1) to (6)
18-20	
21-24	
25-28	
29-32	
33-36	
More than 37	
Q39. Are you:	(1) to (2)
Male	
Female	
Q40. If you were offered a banned PES under medical	(1) None at all to
supervision at low or no financial cost and the banned	(4) a lot of
performance enhancing substance could make a significant	consideration
difference to your performance and was currently not	
detectable, how much consideration do you think you might	
give to this offer?	
Q41. Given the pressures athletes are often under to win, how	(1) Very confident
confident are you that you could refuse this offer?	could refuse to (5)
	would not want to
	refuse
Q42. How confident are you in being able to resist pressure	(1) Very confident
from your team mates to use a banned substance?	could resist to (5)
	would not want to
	resist
Q43. Do you intend to use prohibited substances or methods	(1) Definitely not
to enhance your performance or gain a competitive edge	to (5) definitely will
against your opponents during this season?	(4) 5 (1) 1
Q44. In your sport, how necessary do you believe it is for	(1) Definitely have
athletes to use banned PES at least at some time, to perform	to use to (5)
at the very highest levels?	definitely do not
	have to use

AEPSAD: Agencia Española de Protección de la Salud en el Deporte (Spanish National Anti-doping Organization); PES: performance-enhancing substances; PESM: performance-enhancing substances and methods.

Appendix B. Adaptation of the Sport Drug Control Model for coaches

Constructs	Instrument adaptation
Moral	Coaches were asked to indicate their level of agreement with six
disengagement	statements measured on a Likert scale ranging from 1 (strongly disagree) to 7 (strongly agree). Example items are: "Athletes cannot be blamed for doping use if their teammates pressure them to do it" and "Athletes should not be blamed for doping use if everyone is doing it."
Benefits Appraisal	Benefit appraisal is measured in terms of (1) perceived performance-enhancing effects of banned substances and methods use and (2) likelihood of potential positive outcomes for performing well in sport. Questions were reformulated to adapt them to coaches. For example, to assess (1), participants were asked to rate from definitely would not (1) to definitely would (5) "If any of your athletes were to use a banned PESM of his/her choice, how likely is it that he/she would improve his/her performance?" To assess (2) participants were asked "To what extent does your sport offer you these outcomes if your athletes perform well?" and rate from a lot (1) to not at all (3) six answer-items (i.e., national celebrity status, future financial security).
Threat Appraisal	Threats relating to (1) deterrence and (2) ill-health effects were measured. To assess (1) coaches were asked two questions to measure their perceived likelihood of an athlete being tested in and out of competition, and of evading detection if using doping in and out of competition, using a 5-point scale ranging from (1) very likely to (5) not at all likely. To assess (2) participants were asked to score the harm level of six different PESMs using a 5-point scale from 1 (a lot of harm) to 5 (no harm).
Self-Efficacy to Refrain From Doping	To assess coaches' ability to avoid the use of PESMs within their athletes or resist doping temptation, the ten-item Doping Self-efficacy scale (Lucidi et al., 2008) was used and adapted to coaches (i.e., "to avoid using PESMs with my athletes before a competition even when I know I can get away with it," "to resist the temptation to use PESMs with my athletes to improve their performance"). Participants were asked to rate from completely capable (1) to not at all capable (7).
Goal Orientation	Coaches were asked to indicate their level of agreement with six statements from the ego-oriented subscale (i.e., "I am the best," "I show other people I am the best") using a five point Likert scale from strongly disagree (1) to strongly agree (5).
Subjective Norms	Coaches' perceptions of others' attitudes toward doping were assessed with the following question: "If any of your athletes decided to use a PESM, to what extent do you think each of

the following people would approve or disapprove or would not care either way if they did that?" Six-response items were presented to participants (i.e., parents, teammates, sport doctors, and manager) and asked them to rate from would definitely approve it (1) to would definitely disapprove it (5). Descriptive Norms To assess coaches' beliefs regarding others' use of doping, they were asked to indicate the percentage of perceived doping prevalence in five statements (i.e., "Out of 100%, how many athletes in your sport do you believe engage doping to enhance their performance," "Out of 100%, how many coaches in your sport do you believe would encourage their athletes to use doping to enhance their performance?"). Attitudes Toward Doping Following the work of Petroczi (2002) a single-item was used to measured coaches' attitudes toward the use of PESM: "In your sport, how necessary do you believe it is for athletes to use banned performance-enhancing substances at least at some time, to perform at the very highest levels?" Responses were rated on a Likert scale ranged from 1 (definitely have to use) to 5 (definitely don't have to use). Susceptibility to Doping Susceptibility to doping is measured using a hypothetical scenario adapted from previous research (Bamberger and Yaeger, 1997; García-Grimau et al., 2021). Coaches were asked to imagine a situation to use a PESM with their athletes to
Norms were asked to indicate the percentage of perceived doping prevalence in five statements (i.e., "Out of 100%, how many athletes in your sport do you believe engage doping to enhance their performance," "Out of 100%, how many coaches in your sport do you believe would encourage their athletes to use doping to enhance their performance?"). Susceptibility to Doping Susceptibility to doping is measured using a hypothetical scenario adapted from previous research (Bamberger and Yaeger, 1997; García-Grimau et al., 2021). Coaches were asked
Doping scenario adapted from previous research (Bamberger and Yaeger, 1997; García-Grimau et al., 2021). Coaches were asked
Yaeger, 1997; García-Grimau et al., 2021). Coaches were asked
Yaeger, 1997; García-Grimau et al., 2021). Coaches were asked
enhance their performance. The scenario is described below:
"If you were offered a banned PES under medical supervision at low or no financial cost and the banned PES could make
a significant difference to your athletes' performance and was currently not detectable, how much consideration do you
think
you might give to this offer?"
Responses were rated from not at all consideration (1) to a lot of consideration (4).
Doping Doping prevalence among coaches is measured in terms of
Prevalence self-reported administration or attempted administration to
athletes of a PESM (lifetime or in the last 12 months). For
the lifetime doping prevalence, participants were presented
with seven items/statements and told to indicate which one of
the statements most applies to them. Each item was scored
from 1 (I have never considered using a banned PESM with my
athletes) to 7 (I regularly try or use banned PESM with my
athletes). This variable was transformed in a dichotomous
variable range from 0 (never use PESM) to 1 (ever use). For the
prevalence of doping in the last 12 months, coaches were
presented with six different PESM and asked: "In the last 12
months, how often have you used any of the following PESM
with your athletes, for whatever reason?" Responses were rated
from 1 (have never used) to 6 (more than 10 times). This

	variable was transformed in a dichotomous variable range from
	0 (never use PESM) to 1 (use 12months). These two variables
	were combined and recoded into a single variable measuring
	total doping prevalence among coaches. This variable only
	measures one of the seven possible ADRV that ASP can commit
Indirect Doping	Indirect doping prevalence among athletes were measured by
Prevalence	asking coaches the following dichotomous question: "Have any
Among Athletes	of your athletes ever tested positive for a banned PES?"

ADRV: anti-doping rule violation. ASP: athlete support personnel. PES: performance-enhancing substances; PESM: performance-enhancing substances and methods.
